ABSTRACT

The aim of this report is to study the feasibility of establishing university library systems, based on cooperation and compatibility, which are capable of utilizing all advances in educational theory and modern technology without sacrificing any relevant features of the traditional library. The application, present problems and cooperative possibilities of five areas are explored. These are: (1) acquisitions service, (2) cataloguing services, (3) circulation services, (4) document retrieval services, (5) personnel services and (6) equipment. (MM)

Association of Universities and Colleges of Canada

1969

STANDARDIZATION IN CANADIAN UNIVERSITY LIBRARIES

AN APPROACH AND A PROPOSAL

Abstract of the report.

Several reports published during the last year (the Downs Report, the Macing Report) underscored the urgency of the problems involved and the immense expenditures require rationalized library resources. More important, each report noted many possible areas for out that all institutions, whether rich or poor, faced similar problems, and would in fact co-operative development.

This report is an attempt to initiate long-range action. It has been writ most of the facts involved and are ready to act.

The term automation, in this report, refers to all machines and systems we processing, storing, retrieving, distributing and/or circulating information in university

Each chapter of the report examines the definition of the services, the present problems and the co-operative possibilities. The problems evoked are the following

- 1. Acquisitions services.
- 2. Cataloguing services.
- 3. Circulation services.
- 4. Document retrieval services.
- 5. Personnel services.
- Equipment.

Meaning of cost versus services.

The basis of this proposal is the necessity for the rationalization of ou controlling costs, not for itself, but to provide the best trade-off between costs and serv Costs and services needs on the part of the user are both rising. We must have maximum uti spent through a more appropriate use of data. Co-operation among libraries is the best met resources most effectively and to provide necessary services not possible without co-operat

If we do nothing, those areas of most concern, redundant effort and costs co-ordinated effort towards rationalizing resources and services, will continue and perhaps to remedy. It is already an area of concern to all thoughtful university administrators.

PREFACE

Some months ago, a group of "working" librarians was asked, by automation in Canadian university libraries in order to formulate proposals value development and implementation of a national scheme based on mutual co-operate

The basis of this proposal is the necessity for rationalization means controlling costs but at the same time utilizing the funds available to service to the user.

Several reports published during the last year (the Downs Report the Tyas Report) underscored the urgency of the problems involved and the important, each report noted many possible areas for co-operation and poinstitutions, whether rich or poor, faced similar problems, and would in fact co-operative development.

This modest report is an attempt to initiate long-range action definitive, nor does it offer new insights nor conclusions. It labours the obeen written for those who know most of the facts involved and are ready to depend on timing, we believe the time is now!

- 1 -

PREFACE

roup of "working" librarians was asked, by AUCC, to review the state of ibraries in order to formulate proposals which would lead to the national scheme based on mutual co-operation.

oposal is the necessity for rationalization of library resources. This same time utilizing the funds available to provide the most beneficial

ished during the last year (the Downs Report, the McDonald Report, gency of the problems involved and the immense expenditures required. any possible areas for co-operation and pointed out that all faced similar problems, and would in fact profit from rational,

is an attempt to initiate long-range action. It is not intended to be insights nor conclusions. It labours the obvious once again. It has st of the facts involved and are ready to act. Successful ventures often ime is now!

NOTE

Most figures for this study were drawn from three sources:

- 1. Analysis of automation projects in Canada based on a questionnaire provided by the Committee and compiled by the National Library.
- 2. R.H. Blackburn's analysis of the Downs Report.²
- 3. Latest statistics provided by CACUL. 3

The breakdown of these figures, which reflect total library budgets, excep indicated otherwise, into representative costs for departments, proceeded along the perce of Blackburn's analysis of the Downs Report. Thus, the figures quoted will not be exact, each library involved, but indicate a representative range from which certain general con Figures are rounded for clarity and emphasis.

cations of the Downs Report on Canadian Academic and Research Libraries,

INTRODUCTION

AIM

The aim was to study the feasibility of establishing unico-operation and compatibility, which are capable of utilizing all advantagement technology without sacrificing any relevant features of the traditate university library will become a more effective resource centre recreational needs of the nation.

The term automation, as used in this paper, refers to al used for producing, processing, storing, retrieving, distributing and/or university libraries.

METHODOLOGY

To fulfill this aim, the Library Automation Committee of

- distributed a questionnaire to determine projects so that areas of compatibility co-operation might be assessed.
- established terms of reference for evalu through the questionnaire.
- 3. established a task force to evaluate the

This committee then decided to study the following areas

- 1. Acquisitions services.
- 2. Cataloguing services.
- 3. Circulation services.
- 4. Document Retrieval services.
- Personnel services.
- Equipment.

What follows is an analysis of the data obtained in each

INTRODUCTION

as to study the feasibility of establishing university library systems, based on ility, which are capable of utilizing all advances in educational theory and sacrificing any relevant features of the traditional library. This would ensure ry will become a more effective resource centre for the teaching, research, and nation.

automation, as used in this paper, refers to all machines and systems which are ssing, storing, retrieving, distributing and/or circulating information in

L this aim, the Library Automation Committee of the AUCC:

- distributed a questionnaire to determine existing and projected projects so that areas of compatibility and possibilities for co-operation might be assessed.
- 2. established terms of reference for evaluating the data accumulated through the questionnaire.
- 3. established a task force to evaluate the reports.

ttee then decided to study the following areas.

- 1. Acquisitions services.
- 2. Cataloguing services.
- 3. Circulation services.
- 4. Document Retrieval services.
- 5. Personnel services.
- 6. Equipment.

ws is an analysis of the data obtained in each of these areas.

ERIC

MEANING OF COST VERSUS SERVICES

The rationalization of resources means controlling costs, not the best trade-off between costs and services rendered the user. Costs and service user are both rising. Co-operation among libraries is the best method both to use s effectively and to provide necessary services not possible without co-operation.

halization of resources means controlling costs, not for itself, but to provide and services rendered the user. Costs and service needs on the part of the tion among libraries is the best method both to use scarce resources most ssary services not possible without co-operation.

ACQUISITIONS SERVICES

Acquisitions services will be here defined as the process through \vec{w} so that it will better serve the university's academic programme.

Principal operations involve:

- 1. material selection, both old and new. For the purpos report, the problems inherent in purchasing out-of-pr are not considered. OP material should be discussed problem, since the method of selection, the amount pu and the need varies widely from library to library, a standardized in any one way.
- 2. creation and validation of an order request.
- 3. placing the order
- 4. assigning funds to the order
- on for further bibliographic processing.

<u>APPLICATIONS</u>

- 14 libraries are currently involved with planning for an acquisitions automation system.
- 2. The national average budget expense for acquisition is 40.01 per cent. This represents a cost of from \$1 \$2,600,000 for large libraries; \$90,000 to \$620,000 to libraries. There is a variance from a low of 18.3 per high of 56.5 per cent, though most libraries are closs national average. The total amount spent by 29 librated 1968-69 was \$18,452,921. (Appendix B).

- 5 -

ACQUISITIONS SERVICES

be here defined as the process through which a collection is developed s academic programme.

ve:

ection, both old and new. For the purpose of this problems inherent in purchasing out-of-print material idered. OP material should be discussed as a separate ace the method of selection, the amount purchased, avaries widely from library to library, and cannot be in any one way.

d validation of an order request.

unds to the order

the item when received, so that it can be passed her bibliographic processing.

s are currently involved with planning for or operating ions automation system.

Il average budget expense for acquisition in fiscal 1969-70 r cent. This represents a cost of from \$1,300,000 to for large libraries; \$90,000 to \$620,000 for small. There is a variance from a low of 18.3 per cent to a 5 per cent, though most libraries are close to the verage. The total amount spent by 29 libraries during \$18,452,921. (Appendix B).

3. The number of personnel involved varies from 1/12 total library staff. Personnel numbers seem to rapeople in the department. (Appendix B).

PRESENT PROBLEMS

1. There exists a wide variation from institution to the role Acquisitions plays in the development of system for the library, both in practice and in plays

This can be illustrated by the variations in selections of the selection o

There are also variations in purchasing practices depend wholly on jobbers, others order direct, sti on mammoth blanket order programmes. Each defends on the basis of service and cost reduction.

There are variations also in the control and accordance university libraries have no control of funds number of accurate records, others control all funkeep the official records.

The overall value of this operation in relation to is reflected in the variety of priorities placed oplanning between university libraries.

2. The large number of libraries concurrently working programmes, many of which are similar, demonstrate of effort. Private institutions (Dalhousie), publarge institutions (Alberta), and small institutions engaged in differing mechanized acquisitions programmer.

- 6 -

r of personnel involved varies from 1/12 to 1/4 of the rary staff. Personnel numbers seem to range from 4 to 120 the department. (Appendix B).

sts a wide variation from institution to institution in Acquisitions plays in the development of a total operating or the library, both in practice and in planning.

be illustrated by the variations in selection practice. aries depend wholly on non-library staff recommendations for whereas other universities generate the majority of ordering from subject specialists within the library.

also variations in purchasing practices. Some libraries tolly on jobbers, others order direct, still others are embarked by blanket order programmes. Each defends such programmes as is of service and cost reduction.

variations also in the control and accounting of funds. versity libraries have no control of funds and keep a modest faccurate records, others control all fund expenditures and official records.

all value of this operation in relation to the other services cted in the variety of priorities placed on acquisitions services between university libraries.

e number of libraries concurrently working on mechanized acquisition es, many of which are similar, demonstrates wasteful duplication t. Private institutions (Dalhousie), public institutions (UBC), stitutions (Alberta), and small institutions (Mt. Allison) are all in differing mechanized acquisitions programmes.

 Increasing demands on collections leads financial and personnel resources.

4. Libraries and institutions of similar s are purchasing the same books, although may not be exploited enough to justify

See Downs, p. 208 for increase in volume from 1961-67, e.g. average number Acadia University is 4,428, volumes added 1966-67: 12,000 (p. 209). From t growth in acquisitions can be inferred, as well as staff problems involved

- 7 -

ng demands on collections leading to increased acquisitions have strained and personnel resources.

and institutions of similar size, in the same geographical area, nasing the same books, although in many cases, individual collections be exploited enough to justify this.

rom 1961-67, e.g. average number volumes added 1961-66 for 966-67: 12,000 (p. 209). From these two tables the explosive well as staff problems involved in this increase.

CO-OPERATIVE POSSIBILITIES

- 1. Adoption of standardized software based on successful operating systems supplied from a technical services center within the National Library, along with "borrowed" programming personnel during installation period, to facilitate on site changes, or
- 2. Development of a commercial service based on standardized software, which would provide the same result as the above, with less cost and less disruption in the library. Many jobbers have such programmes in full working state.
- Adoption of a standard book number by Canadian booksellers which would expedite the ordering process, and minimize bibliographic typing and errors.
- 4. A review of acquisitions policies, leading to the establishment of specialized collections on a national basis, with specific responsibilities beyond their immediate community of users.

It is no longer possible for a library to have a copy of everything. This implies a rationalization of resources and services so that the burden is shared by all libraries, therefore, duplication should be minimized wherever possible. The mechanism for satisfying this need not be expensive. A number of loan request services have already been introduced. For example, inter-library truck or postal delivery. Urgent requests are handled by telephone or telex. Where truck or postal delivery telephone or telex services do not fulfill the needs of a scholar, consideration should be given to sending him to the library with the appropriate special collection is housed.

5. Establishment of a communications network which would provide a centralized clearing house. This would help expedite any scheme developed above.

CATALOGUING S

1

Cataloguing services will be here defined as so they may be available to the user. They include:

- 1. describing the item
- 2. classifying the item
- 3. assigning subject headings
- 4. preparing item for use
- 5. preparing all additional services for the

APPLICATIONS

- 10 libraries are currently involved in plantage cataloguing system. (Appendix A.)
- 2. Cataloguing services seem to involve from part-time equivalents amounting to 1/3 of It is difficult to provide absolute figure in the services they included in their representation cataloguing services costs as much as \$1,0 library can spend as little as \$30,000 years.

PRESENT PROBLEMS

- 1. There is a considerable backlog of materia
- The Library of Congress proof distribution our cataloguing is based, though much impr local library needs. In addition coverage

_ 0 _

CATALOGUING SERVICES

loguing services will be here defined as those services which are used to prepare all items o the user. They include:

describing the item classifying the item assigning subject headings preparing item for use preparing all additional services for the user which result from the above

10 libraries are currently involved in planning or operating an automated cataloguing system. (Appendix A.)

Cataloguing services seem to involve from 10 to 200 persons in full or part-time equivalents amounting to 1/3 of any given personnel budget. It is difficult to provide absolute figures since departments vary in the services they included in their report. For large libraries cataloguing services costs as much as \$1,000,000 yearly, while a small library can spend as little as \$30,000 yearly. (Appendix B.)

There is a considerable backlog of material to be catalogued.

The Library of Congress proof distribution system, on which much of our cataloguing is based, though much improved, continues to lag behind local library needs. In addition coverage is inadequate.

- 3. The inadequate coverage of the Library of Congress cataloguing programme results in:
 - a) many libraries cataloguing the same books at the same time.
 - b) duplication in constructing classification schemes and cataloguing Canadiana material.
- 4. The lack of understanding of users needs and of the cataloguing record's purpose lends to needless proliferation of techniques and standards in cataloguing details because of local demands which are not always justified.
- 5. Another problem is that of subject headings. They are neither correct nor relevant. The existing approach is not working. Interdisciplinary complications and the bifurcation of subject areas is placing a great strain on present subject analysis.
- 6. Excessive reliance on others to get the job done.
- 7. There are technical problems which must be overcome. For example:
 - a) MARC II in a format IBM equipment (predominant in Canada) can handle.
 - b) Character incompatibility and the necessity for upper and lower case printouts.
 - c) The necessity for file accession by record number or data patterns.

SEE ALSO APPENDIX G.

CO-OPERATIVE POSSIBILITIES

- 1. Establishment of cataloguing standards for machine systems.

 This will require some adjustments by individual libraries.

 However, these should be kept to a minimum, particularly since a catalogue card should be seen as a location device with only certain kinds and amounts of bibliographic information.
- 2. A nation wide service, located in the National Library, with a machine readable catalogue to which participating libraries would give as well as receive information, would eliminate such duplication and expense through shared cataloguing (similar to the system already in use in the USA).
- a) A possible approach to <u>shared cataloguing</u> could be through assigned <u>subject specialties</u> (e.g. Oceanography at Dalhousie, Medieval History at UBC) which would make an individual library responsible for cataloguing all books required by the national system in its subject specialty. This cataloguing, in machine readable form, would be available to the remaining members of the system. This scheme could be developed as a cojunct to the rationalization of resources.
 - MARC II conversion. This could then be used for cataloguing purposes, and could also be used to form the nucleus of an outstanding national documents location and retrieval device.
 - c) The central clearing house will also develop techniques which will allow for new approaches for resolving subject heading problems.
- The above possibilities require an effective communications network.

28

III.

CIRCULATION SERVICES

Circulation services will be here defined as those services organization relevant to prompt delivery of items to borrowers, and all auxiliary of items on loan. Principal operations are:

- 1. charging and discharging
- 2. fine accounts and other charges
- 3. searching for missing collections items
- 4. stack maintenance and shelving

APPLICATIONS

- 1. 15 libraries are currently involved in planning or op an automated circulation system. (Appendix A.)
- 2. 50 per cent of the systems now in use employ IBM equi input and output, with the remainder divided among se companies. (Appendix F).
- 3. If Circulation is considered as representing 14 per of budget of a library, large libraries spend from \$130, yearly, while small libraries spend from \$5,000 to \$6. The estimated number of personnel used for circulatic part-time to 60 full-time employees.
- 4. Only two libraries, UBC and Guelph, are developing pranalysis of machine readable statistics they have accollection use. Data resulting from these projects of the buying and borrowing habits within universities.

- 12 -

CIRCULATION SERVICES

ervices will be here defined as those services which make the provision for the ivery of items to borrowers, and all auxiliary operations implicit in the control ions are:

ng and discharging
accounts and other charges
ing for missing collections items
maintenance and shelving

raries are currently involved in planning or operating omated circulation system. (Appendix A.)

cent of the systems now in use employ IBM equipment for and output, with the remainder divided among several other lies. (Appendix F).

rculation is considered as representing 14 per cent of the annual of a library, large libraries spend from \$130,000 to \$300,000 y, while small libraries spend from \$5,000 to \$60,000 yearly. Stimated number of personnel used for circulation is from l time to 60 full-time employees.

two libraries, UBC and Guelph, are developing programmes for the sis of machine readable statistics they have accumulated on ction use. Data resulting from these projects could change uying and borrowing habits within universities.

PRESENT PROBLEMS

- 1. Equipment in use has been adapted from purposes. It is, therefore, not as fun
- 2. Circulation is most often considered in operations, which reduces its effective valuable statistical patterns of use to many circulation systems cannot supply in a manner compatible with any propose
- Circulation is more restricted by the and function, than any other library or
- 4. Many of the present circulation systems and demeaning by borrowers. Any system problem.
- 5. Several libraries have embarked on circ automation project for reasons, and at which may not be justified.

CO-OPERATIVE POSSIBILITIES

- 1. <u>Circulation systems must be designed</u> so borrower is minimized.
- 2. Since circulation systems are designed all be compatible with any proposed nat book status information.

- 1. Equipment in use has been adapted from equipment designed for other purposes. It is, therefore, not as functional as might be.
- 2. Circulation is most often considered in isolation from other library operations, which reduces its effectiveness, since it can contribute valuable statistical patterns of use to administrators. At present, many circulation systems cannot supply current book status information in a manner compatible with any proposed national communications network.
- 3. Circulation is more restricted by the environment, physical location, and function, than any other library operation.
- 4. Many of the present circulation systems are felt to be too burdensome and demeaning by borrowers. Any systems developed must overcome this problem.
- 5. Several libraries have embarked on circulation as their first principal automation project for reasons, and at a time within their development, which may not be justified.
- 1. Circulation systems must be designed so that effort on the part of the borrower is minimized.
- 2. Since circulation systems are designed to do similar things, they should all be compatible with any proposed national network and should provide it with book status information.

- 3. Statistical and user analysis can provide valuable feed-back information on the performance of library networks; it can also help acquisitions and circulation policies.
- 4. Circulation is well defined, from a systems point of view, as inventory control, thus <u>shared systems programming and techniques</u> would reduce wasteful duplication.
- 5. A national clearing house of personnel and software is needed. This too might best be the responsibility of the National Library.
- 6. It is obvious once again that the above requires an effective national communications network.

DOCUMENT RETRIEVA

IV.

Document retrieval will be defined here as the allow recovery of material corresponding to the terms selected by the made clear that this is not a new service. Libraries have always been what has changed is the potential of the new machines for revamping to

Information retrieval is not considered in this which must be solved, the unpredictable magnitude of the costs which agreement as to the role it should play, all tend to eliminate everytime. Although the dream of every user is a highly sophisticated information need on demand, the state of the art in Nortwork is needed before serious committment on the part of libraries can both practicable and promising, particularly since it has been adaprojects.

APPLICATIONS

- 1. A small group of libraries are engaged is a great disparity between systems in specialized nature of the projects unde
- 2. UNB estimates a figure of \$12.00 per do costs) in its system. Laval's MIRACODE preparation and processing, exclusive of \$12.00 per do costs)

PRESENT PROBLEMS

- The intellectual problems which must be clearly defined or understood.
- There is a lack of qualified subject an any system, designed or implemented.

DOCUMENT RETRIEVAL SERVICES

retrieval will be defined here as the application of an indexing scheme to responding to the terms selected by the documents searcher. It should be new service. Libraries have always been involved in documents retrieval. tial of the new machines for revamping traditional techniques for retrieval.

tion retrieval is not considered in this report. The intellectual problems redictable magnitude of the costs which must be incurred, and the lack of hould play, all tend to eliminate everything but passing interest at this every user is a highly sophisticated information system which will respond on demand, the state of the art in North America is such that much development committment on the part of libraries can result. Document retrieval, though, sing, particularly since it has been adapted successfully to specialized

A small group of libraries are engaged in document retrieval work, but there is a great disparity between systems in use. This occurred due to the specialized nature of the projects undertaken. (Appendix A.)

UNB estimates a figure of \$12.00 per document (for processing and programming costs) in its system. Laval's MIRACODE costs \$1.30 per article for preparation and processing, exclusive of maintenance and depreciation costs.

The intellectual problems which must be solved have not, as yet, been clearly defined or understood.

There is a lack of qualified subject and indexing specialists to support any system, designed or implemented.

3. There is a lack of:

a) a uniform retrieval point of view

b) understanding of many of the interdisciplinary complications arising from interdependence of knowledge and mission-oriented approaches which has made it difficult to structure new approaches.

c) adequate coverage for languages other than English.

- d) understanding of the processes of distribution, dissemination and storage of messages in great quantities for easy access.
- 4. University libraries, as a whole, are not developing or adopting approaches to such reference services.
- The size of the files involved, particularly retrospective files, is so large that costs are most prohibitive.
- 6. The cost of documents retrieval, for most libraries, is higher than the value of having this service at the present time.

CO-OPERATIVE POSSIBILITIES

- 1. A large number of intellectual problems must be solved before co-operative action on documents retrieval is possible.
- 2. A method of developing, assessing and sharing costs must be found.
- 3. A national committee should be established to monitor progress in this field until the technical processes involved are sufficiently advanced to warrant general action.

PERSONNEL SERVICES

In this report, Personnel covers both library staff Consideration of this area is complicated, in the case of library staff, numbers employed are given as totals only. A division of personnel by liningights than the present scheme.

The report on Computer center Personnel is more det different standards in reporting, including different titles for the same show library and computer center resources, while Appendix C and Appendix

PRESENT CONSIDERATIONS

٧.

- 1. The national average for budgeting salaries 36.1 per cent and a high of 76.8 per cent, the national average. Since the financial below \$500,000, and in six cases exceeds \$200,000 are important. Total salaries for 29 university.
- 2. Salaries are also rising sharply, and can have so if competent professionals are to be attached designers, analysts, and planners will also complement existing needs.
- 3. There is a rising tide of user service expendence content to have the library a passive dynamic service or fail in its purpose. The efficient co-operation could be applied to library service efficiency.
- 4. Computer center resources are considerably systems staff resources, and although librathe computer center skill pool with ease, a dialogue exists between computer centers is clearly one of the opposite. (Appendix

PERSONNEL SERVICES

t, Personnel covers both library staff and the staff of the computer center. icated, in the case of library staff, by the fact that salary cost and s only. A division of personnel by library duty would have provided more

Computer center Personnel is more detailed, but firm conclusions are blocked by ncluding different titles for the same position. Appendix A and Appendix D sources, while Appendix C and Appendix E give further details.

ational average for budgeting salaries is 54 per cent, with a low of per cent and a high of 76.8 per cent, most libraries being close to ational average. Since the financial range involved rarely falls \$500,000, and in six cases exceeds \$1,000,000, salary expenditures important. Total salaries for 29 universities were \$23,665,409.

ries are also rising sharply, and can be expected to continue to do f competent professionals are to be attracted to the field. Systems gners, analysts, and planners will also be in heavy demand to lement existing needs.

e is a rising tide of user service expectation -- the user is no er content to have the library a passive entity -- it must render mic service or fail in its purpose. Thus the money saved in cient co-operation could be applied to user services for greater ary service efficiency.

uter center resources are considerably greater than library ems staff resources, and although libraries are able to call upon computer center skill pool with ease, there is no indication that alogue exists between computer centers and libraries. The impression learly one of the opposite. (Appendix D.)

5. Where computer center staff, evidently a rare and commodity, is detailed in a number of universiting development and support for the same system, this effort is extremely wasteful.

CO-OPERATIVE POSSIBILITIES

- 1. The clearing house proposed above in Sections I enable scarce staff pooling of existing personne responsible for training and recruiting potential for participating libraries.
- 2. Most library staffs are expected to continue to Only pooling of talent can prevent disastrous pershortages. (Appendix C.)
- There is a sufficiency of human resources availate the central systems service center to be staffed to national needs. (Appendix E.) For the same supplied (to libraries), by each University center are not sufficient. Unless human resources are we face cannot be solved.
- 4. Co-operative projects among libraries will lesses with general service increases in all sectors of be more acute in the light of the predicted dear staff.

- 18 -

omputer center staff, evidently a rare and expensive by, is detailed in a number of universities to concurrent nent and support for the same system, this duplication of is extremely wasteful.

aring house proposed above in Sections I, II, and III would scarce staff pooling of existing personnel, and would be ible for training and recruiting potential personnel ticipating libraries.

prary staffs are expected to continue to increase. pling of talent can prevent disastrous personnel es. (Appendix C.)

s a sufficiency of human resources available to enable tral systems service center to be staffed at a level adequate onal needs. (Appendix E.) For the same services to be d (to libraries), by each University center, the human resources sufficient. Unless human resources are pooled, the problems cannot be solved.

ative projects among libraries will lessen the strain concomitant neral service increases in all sectors of the library, which will acute in the light of the predicted dearth of professional

ŅI.

EQUIPMENT SERVICES

Equipment services will be defined as the computers used Input/Output devices.

PRESENT CONSIDERATIONS

- With few exceptions, programming languages used to Software packaging, however, would require reconmultiple programming appraoches taken to the solu
- 3. Since most libraries in Canada do not own the corprocess their programmes, duplication of effort the library, but also the university community de

CO-OPERATIVE POSSIBILITIES

1. Hardware and software incompatibility could be re of hardware or software systems to satisfy the of systems. This would facilitate programme exchange

- 19 -

EQUIPMENT SERVICES

will be defined as the computers used by each university, and their attendant

ority (at least 60%) of the universities reporting to the committee computers (appendix A), indicative of a large equipment compatibility.

ceptions, programming languages used will allow common use. ckaging, however, would require reconcilation of the ogramming appraoches taken to the solution of identical problems.

libraries in Canada do not own the computing facilities which ir programmes, duplication of effort in this area involves not only , but also the university community dependent upon computer services.

nd software incompatibility could be reduced through the development or software systems to satisfy the objectives of co-operative This would facilitate programme exchanges.

SUMMARY

If we do nothing, those areas of most concern, redundant effort of any co-ordinated effort towards rationalizing resources and services, will continue become more difficult to remedy. It is already an area of concern to all thoughtful

CONCLUSIONS

- 1. Although there is a great deal of activity in Canadian Libraries, much of it is in similar areas, and with a no clearly defined programme is being followed.
- There is some degree of compatibility among libraries of used, in programming languages, and in personnel support
- 3. There emerges from the review a widespread agreement a mechanization developments.
- 4. There is a desire for standards to relieve the present evaluation and planning.
- 5. There exists both the means and desire to bring order co-operative activity.

43

- 20 -

SUMMARY

hing, those areas of most concern, redundant effort and costs, the absence rationalizing resources and services, will continue and perhaps It is already an area of concern to all thoughtful university administrators.

- bugh there is a great deal of activity in Canadian University aries, much of it is in similar areas, and with a few exceptions, learly defined programme is being followed.
- e is some degree of compatibility among libraries in equipment, in programming languages, and in personnel support requirements.
- e emerges from the review a widespread agreement about areas for anization developments.
- e is a desire for standards to relieve the present confusion in uation and planning.
- e exists both the means and desire to bring order and to pursue perative activity.

RECOMMENDATIONS

- 1. A common catalyst and co-ordinator to provide guidance in planning, help in implementation, and review in monitoring any systems developed <u>must be provided</u>.
- 2. Special funding for the operation must be obtained through federal/provincial financing, through direct university financing, through service charged to the user, or a combination of all of the above. An agency must be established in the National Library with authority to:
 - a) Establish priorities for automation projects, after appropriate study and research review.
 - b) make special grants to enable project implementation.
 - c) make grants to users for services rendered.
 - d) provide programme and personnel for interested institutions, on a sharing basis.
 - e) provide continuous educational programmes for personnel.

The AUCC must appoint a working group in consultation with CACUL to review any projects proposed, and to act as necessary as they see fit in other matters.

- 3. Attempts must be made to <u>interest commercial software producers</u> in specialized library problems. This would speed a solution.
- 4. A national communications network, co-ordinated in accord with the above elements and imposed on the existing state of development is needed. This would enable us to make maximum use of our resources at minimum costs. Such an arrangement seems to involve regional orientation.

These suggestions take advantage of the compatibility already present and will aid in the establishment of an intellectual service of undisputed excellence for the welfare of Canadians.

[#] In those cases where there was some attempt to measure the benefits of the automation progress of the methods of benefit analysis nor indication of its extent. In few cases is this analysis SHERBROOKE does not evaluate benefits, enjoys good relations with its computer center, on detail of computer center staff.

^{*} In all cases save Ottawa (agreement still pending) libraries bear the whole cost of automat at all.

APPENDIX F

This is the summary which represents our interpretation of the data compiled from the questionnaire which was sent to all universities. We apologize for any misinterpretation of data. A sample of the questionnaire is added in Appendix I. Errors and omissions should be forwarded to the AUCC Library.

Since the Library of Congress (in conjunction The reason for the different systems is inherent in the data elements

I. Objective of a Machine-Readable Catalogue

machine-readable catalogue is a necessity for Canada, it seemed necessary to establish the objectives of such a catalogue at three levels: Although the MacDonald report, among others, insists that a national

- 1) local
- 2) regional
- 3) national

1. Local objectives of machine-readable catalogue

A. Definition

A machine-readable catalogue contains the <u>complete</u> bibliographic record for a title, which is normally displayed on the main-entry card in the public catalogue. An off-line system on magnetic tape is all that is presumed at present.

B. Objectives of the system for internal library use.

- which are necessary to assist the user to gain access to the contents of the lbirary. This would include:
- i) catalogue cards, with headings added, in alphabetic sequence for filing in the public catalogue
- ii) spine labels
- iii) pocket labels (or pocket)
- iv) book card (for circulation system)
- b) to update the catalogue or file on tape, and create such statistics as are defined.
- c) to maintain authority files, such as subject and series
- d) to produce special print-outs as required:
- i) book catalogues for specialized subject or area
- ii) accession lists
- iii) shelf lists for stock taking purposes

Regional objectives

It is assumed, (and the Ontario IUTS statistics bear this out) that the dependence of one university library on another is almost entirely a regional matter. In other words, 90 per cent of requests for material not held in a particular library, can, on the average, be met in the region. With this assumption as a background, the objectives of a regional system are basically no different than a

11) accession lists

iii) shelf lists for stock taking purposes

Regional objectives

It is assumed, (and the Ontario IUTS statistics bear this out) that the dependence of one university library on another is almost entirely a regional matter. In other words, 90 per cent of requests for material not held in a particular library, can, on the average, be met in the region. With this assumption as a background, the objectives of a regional system are basically no different than a national one.

Objective

a form that it can be accessed quickly by any other library. The need for such access would be: (and other research or reference libraries) within a region, in such To provide an up-to-date union catalogue of all university libraries

- i) to obtain catalogue copy
- ii) to determine if a title is already in another library, or on order in another library
- iii) to determine a location for a title so that it could
 be borrowed
- iv) to provide a switching mechanism to a national system if the need can not be met within the region.

3. National objectives

has been tried and has not succeeded) but which would be possible if resources of all our libraries. This implies an up-to-date union would be similar to the regional ones. in machine-readable form. catalogue, which, MacDonald states, is not feasible manually (this catalogue is needed in Canada because we haven't the time or money to build a single national resource library and must depend on the The MacDonald report suggests that a machine-readable union The actual objective of the catalogue itself

127

Objectives

- i) capability of providing location information
- ii) capability of providing pn order information
- iii) capability of providing catalogue copy
- iv) capability to switch a request from one area to another,
 if necessary.

+. Requirements

1. Local

a) To meet the objectives of the local system the requirements need not be very sophisticated. For instance, upper case only may be quite-adequate for all printing purposes, including catalogue cards. Some libraries have experimented with very simple formats for their machine-readable files, however with less than successful results, and the following points should

iv) capability to switch a request from one area to another;
if necessary.

4. Requirements

1. Local

- a) To meet the objectives of the local system the requirements need not be very sophisticated. For instance, upper case only may be quite-adequate for all printing purposes, including catalogue cards. Some libraries have experimented with very simple formats for their machine-readable files, however with less than successful results, and the following points should be made:
- i) The only unique number for a book which has any meaning is the call number. The L.C. call number is a very complicated number, with fields and sub-fields which vary from one classification to another. This number can be used, however, if all the variables within it are developed, and adequate space is left for it. (This is no problem if handled in a variable field. For quick sorting, however, a fixed field will have to have at least 46 characters.)
- ii) Any data element which is included in the record should be complete, i.e. it can be agreed to eliminate certain data elements, such as notes, but for those elements which are described the compelte information available should be used,

PART

or the record loses its usefulness and validity.

iii) To provide the capability of different formats or quick sorting, the many delimeters and fixed codes of the MARC II

format can be very useful.

b) No matter what requirements a library has for its in-house operation of a machine-readable catalogue, if it needs to be, or should be, part of a regional or national network it is going to have to be able to communicate with other libraries. To do this it is going to have to be able to convert its own catalogue format to one that is usable or acceptable to the network.

129

c) This standardized format must obviously be MARC II. No library in Canada has the money to develop and support a comparable system.

d) If a library is going to use a different format than MARC for its own processing, it must have a program which converts its own data to the MARC II format. This implies that all the fields, subfields, delimeters, codes, etc. of the MARC system must be captured in the original input, whether they are used in processing or not.

Regional and national

The regional and/or national centre will need to maintain union catalogues, either of all libraries in the regions, or of the complete country (see also below). Several problems exist:

a) To maintain a complete union catalogue in an interrogation mode at all times would cost a prohibitive amount (over \$1,000,000 per

to the MARC II format. This implies that all the fields, sub-fields, delimeters, codes, etc. of the MARC system must be captured in the original input, whether they are used in processing or not.

2. Regional and national

The regional and/or national centre will need to maintain union catalogues, either of all libraries in the regions, or of the complete country (see also below). Several problems exist:

- a) To maintain a complete union catalogue in an interrogation mode at all times would cost a prohibitive amount (over \$1,000,000 per annum).
- b) To interrogate this file implies a key. The key to the MARC II record is the L.C. card order number. This would not be applicable in Canada, since so many of our records do not have card order numbers, if for no other reason. However, since many people will want to interrogate the union catalogue before they have correct bibliographic details, some method of access dependent on parts of identifying data elements will be necessary.
- c) Given the above parameters, the following system is envisaged:
- i) Each library participating in the system would send its data to the network centre in a daily <u>batch</u> basis. The data would consist of three kinds of information:
- (a) catalogue records processed that day

- (b) status information
- (c) on order information
- ii) Each unique record at the network centre will be given a serial number.
- iii) A key or code for the record will be developed (see iv. below)
- iv) An index, consisting of the serial number and code will be maintained in easily accessible mode, for interrogation.

131

v) If the complete record is needed, the serial number provides access. The complete record can be maintained in inexpensive tape or disk storage.

vi) The code

Although much research needs to be done, a code, developed from key data elements and which can be automatically derived seems to provide the solution to accessing the file. Reuking (see Library Automation, January 1969) has done work in this direction. Staff at the University of Saskatchewan are also experimenting with the same code.

- vii) It is assumed that each library holding a certain title will send it to the network centre. If the record is already in the file, a location code for the second (and subsequent) library will be added. The location field would be almost the first item in the record.
- viii) Status information will also be a necessary part of the network file. This includes both On order and Circulation

seems to provide the solution to accessing the file. Reuking (see Library Automation, January 1969) has done work in this direction. Staff at the University of Saskatchewan are also experimenting with the same code.

- vii) It is assumed that each library holding a certain title will send it to the network centre. If the record is already in the file, a location code for the second (and subsequent) library will be added. The location field would be almost the first item in the record.
- viii) Status information will also be a necessary part of the network file. This includes both <u>On order</u> and <u>Circulation</u> or status information. For example, if Library A needs a book and discovers Library B has it through the network, it is useless for him to ask to borrow the book from Library B only to find it is out to the Bindery or is in poor physical condition and can't be borrowed. The On order information would not be too difficult to maintain in a network file. Circulation data would present more of a problem.

132

5. Questions not answered

i) Do we need both regional centres with union catalogues in machine-readable form and a national catalogue in machine-readable form?

ii) Should the regional centre have a complete national union

catalogue?

- iii) Should the two national libraries maintain separate machine- readable catalogues with switching devices?
- iv) How important is standardization? Can the system be flexible enough to tolerate other than the agreed to standard format?

6. Areas in need of research

i) Development of a code for the records in the file.

133

- ii) Cost studies of national centre vs. regional centres.
- iii) Development of editing program to maintain quality of input

to union catalogues.

- iv) Study of addition of status information to the records in the union catalogue.
- v) Development of programs for management information or analysis of resources.
- vi) Development of an access code to the MARC tapes so that they can be used as part of the acquisitions system. This code could be the same as that necessary for the union catalogue.
- vii) Development of both the systems and hardware to make full use
 of MARC tapes in the local cataloguing systems. (Display,
 correction, added to file, processing, etc.)
- viii) Development of programs for converting files in upper case or non-MARC format to the standard format.

of resources.

- vi) Development of an access code to the MARC tapes so that they can be used as part of the acquisitions system. This code could be the same as that necessary for the union catalogue.
- vii) Development of both the systems and hardware to make full use of MARC tapes in the local cataloguing systems. (Display, correction, added to file, processing, etc.)
- viii) Development of programs for converting files in upper case or non-MARC format to the standard format.
- ix) Study of deviation from L.C. cataloguing in both current and retrospective systems.

/

x) Study of the cost of having a title in a particular library
when it is needed, as opposed to the cost of maintaining the
national system mentioned above to eliminate such duplication.
i.e. How important is it to a faculty member to be able
to browse and find a title in his own collection?
xi) Studies of all library costs. What does it cost to catalogue,
circulate, shelve, etc.?

7. Systems organization and costs

i) The cost of converting a retrospective catalogue record to complete machine-readable from in a format similar to MARC is approximately \$1.25 per title. Eliminating some data clements

reduces the cost very little.

ii) Advantages of being-part of the network system, and therefore following a standard format, include the receipt of catalogue copy in machine-readable form. If a library had its own machine-readable cataloguing system, it could process all titles very cheaply.

135

- iii) The regional centre (if this is accepted) will have to be independent of any particular university. The Bibliographic Centre in Ontario is an example.
- supply the authority (or persuasion) to start the network operating. This could be done through grants for both conversion of catalogues and research. Any library not agreed-to format, etc. would not receive a conversion grant. Grants would be based on size of file. Dates should be set for completion of work. Research grants should be awarded based on work in process. A Committee (perhaps with members of AUCC automation task force) could recommend the research grants.
- v) Contract grants could also be considered for particular items

supply the authority (or persuasion) to start the network operating. This could be done through grants for both conversion of catalogues and research. Any library not prepared to participate in the network by following the agreed-to format, etc. would not receive a conversion grant. Grants would be based on size of file. Dates should be set for completion of work. Research grants should be awarded based on work in process. A Committee (perhaps with members of AUCC automation task force) could recommend the research

v) Contract grants could also be considered for particular items of research. Library schools with the capability could participate in this area.

grants.

vi) The libraries which have already converted their catalogues should receive grants on a per title basis, similar to grants for work to be done.

136

APPENDIX

Ħ

AUCC COMMITTEE ON LIBRARY AUTOMATION

Statement on Objectives for Library Automation

I Objectives of Library Automation for Canadian University Libraries.

II Functional Requirements for Analysing Objectives.

III Evaluative Requirements for Analysing Objectives.

IV Conclusions.

I Objectives of Library Automation for Canadian University Libraries

encompasses the application of the new technologies to all University described include machines (i.e. computers, communications devices, etc.) and distributing or circulating information. The new technologies Library Systems used for producing, processing, storing, retrieving, which are relevant to the process. and all intellectual systems (programmes, systems analysis, etc.) The term "automation" in the context of this statement

The aim, then of the University Library Automation Committee can be expressed as follows:

To study the feasibility of establishing systems among university libraries, based on co-operation and compatibility, which are capable of utilizing all the available advances in educational theory and modern technology from which we can benefit without sacrificing any of the relevant features found in traditional libraries. This will ensure that libraries will become more effective resource centres in support of the teaching, research, and recreational needs of the nation places in which individual users and learners, whether they be students, faculty members, research workers, employees, or local citizens can extend themselves toward their own individual excellence at their

extend themselves toward their own individual excellence at their faculty members, research workers, employees, or local citizens can Places in which individual users and learners, whether they be students, support of the teaching, research, and recreational needs of the nation ensure that libraries will become more effective resource centres in of the relevant features found in traditional libraries. This will modern technology from which we can benefit without sacrificing any of utilizing all the available advances in educational theory and libraries, based on co-operation and compatibility, which are capable

Such a statement demands the fulfillment of several ends. Simply

(1) 7. ...

(1) To promote the increased sharing of resources by libraries,

and geographical jurisdiction.

to facilitate the sharing of resources and reduce the costs

necessary for developing and maintaining these resources.

(3) To expend the availability of library materials to every

user and potential user in the country.

1 2 1

(4) To ensure the continuing assessment of resources, both humain and physical, within the systems so that provision for filling.

Such intent implies many added goals:

- (a) It implies a degree of "democratization of information", in which all information is made as uniformly available as feasible. There would be no levelling of resources; rather, a formal mechanism would be created by which major resources are protected and yet are made readily available.
- (b) It implies a steady increase in the ability to serve at all points of service. This means the building-up of appropriate local collections to meet immediate needs and the provision of the ability to draw on larger resources as required.
- independent of their administrative base.

 d) It implies a division of function based upon efficient utilization of the co-operative network, and not upon is made through the most convenient local agency, and not through some administrative hierarchy.

- (c) It implies a co-operative sharing among libraries, independent of their administrative base.
- It implies a division of function based upon efficient utilization of the co-operative network, and not upon administrative boundaries. Thus, delivery of materials is made through the most convenient local agency, and not through some administrative hierarchy.
- (e) It implies an increasing degree of specialization in the collections and interests of individual libraries, so that intellectual and financial resources are not dissipated in duplication of more broadly available
- material.

 It implies a sense of responsibility by the individual
- (f) It implies a sense of the support of the costs a willingness to serve others and to support the costs of operating larger collections on which it may draw of operating larger collections of equipment -
- (g) It implies an increase for data processing and communication at clearly for data processing and communication at clearly defined points, thus providing a rationale for installation of specific levels of equipment.
- (h) It implies a willingness on the part of libraries to co-operate, in a voluntary but responsible manner, including a willingness to accept certain common standards

for acquisitions, cataloguing, and methods of

operation.

(i) It implies the creation of a new view of the library on the part of librarians as well as users - as the place to go for information needs of all kinds.

II Functional Requirements for Analysing Objectives some means for co-operative systems and the co-ordination of systems In considering objectives in the light of ultimately obtaining

development, it appears essential to establish functional requirements and to identify the relationship of existing systems to these requirements. When the requirements can be stated in this context, consideration can be given to the determination of what is needed. Functional requirements are listed below and defined

separately. 1. Optimized cost/performance.

- Operational capacity.
- Management information. General information services.
- Special information services. External resqurce development.
- External resource sharing.
- 1. Optimized cost/performance the best cost/performance combination 8. Rationalized resource development.

- General information services.
- Special information services.
- External resqurce development.
- 7. External resource sharing.
- 8. Rationalized resource development.
- 1. Optimized cost/performance the best cost/performance combination the lowest cost, and will be directly affected by the level of service in relation to existing equipment and resources. This is not necessarily in terms of the objectives expected for a Specific operational system
- 2. Operational capacity the ability of a system to adapt to increased Systems change: the absence of extra capacity and a resulting breakdown maintaining existing demands. This is often the root cause for service demands and to satisfactorily deal with peak loads, while . expected and the alternatives available to the library.
- 3. Management information the requirement of providing data about determination of all necessary changes. for the purpose of administering the total systems including the Operations services and resources for the various parts of the systems,

4. <u>General information services</u> - the requirements for maintaining and

on an overall basis (without distinctions between various users). developing acceptable levels of service to users in any institution

5. Special information services - the requirements for maintaining and

developing services that are unique to a single user or group of

users, relative to their particular needs or interests.

6. External resource development - the requirements for establishing human and physical resources needs as they relate to the development

of regional and national co-operation,

7. External resource sharing - the facility of co-operatively sharing equipment and staff. resources that can be feasibly shared; collections, processes,

8. Rat: onalized resource development - the requirements for allocating responsibility along geographic realities, in terms of reducing

III Evaluative Requirements for Analysing Objectives

in a manner which will allow for the development of the system best In analysing the objectives and functional requirements

on two factors; suited for the AUCC, it is essential to establish priorities based

· III Evaluative Requirements for Analysing Objectives

In analysing the objectives and functional requirements in a manner which will allow for the development of the system best suited for the AUCC, it is essential to establish priorities based on two factors;

- A. Responsibility levels.
- B. Types of organizations involved.

What follows is a description of these factors:

A. Responsibility levels

1. LOCAL the requirements to meet the objectives for the local system in relation to specific needs of the institution.

2. PROVINCIAL/REGIONAL

the requirements for meeting the objectives for a provincial/ regional system in relation to the specific needs of the geographic area.

3. NATIONAL objectives for a national symmetry the requirements for mecting the

in relation to the specific riceds of the nation.

4. INTERNATIONAL

the requirements for meeting the .in relation to the effective objectives for a national system participation and representation in international developments.

Types of organizations involved 1. College and University libraries

Public libraries

4. Provincial and Federal Government libraries, Special libraries

Libraries within these categoriés will have to be

studies to determine their requirements and their potential contribution to any systems developed.

IV. Conclusions

denominator is developed for evaluating the contribution of each participating Finally, none of the foregoing has validity until a common

institutions. The more important criteria that must be measured, includes;

- 3. Special libraries
- Libraries within these categoriés will have to be 4. Provincial and Federal Government libraries. studies to determine their requirements and their potential contribution to any systems developed.

IV. Conclusions

denominator is developed for evaluating the contribution of each participating Finally, none of the foregoing has validity until a common

institutions.

The more important criteria that must be measured, includes;

- 1. Existing physical resources and services.
- Human resources available.
- Equipment available.
- Financial support.
- To be effective, these criteria must be examined with

the aim of developing specifications for rating participating institutions

within the context of the role they are to play.

Association of Universities and Colleges of Canada

Association des Universités et Collèges du Canada

Refer to file/Mentionnez le dossier

At the second CACUL Conference on Automation held at the School of Library Science University of Toronto, on March 7th and 8th 1968 the following motion was passed.

"The participants recommend that the Association of Universities and Colleges of Canada establish a Committee charged with the responsibility of investigating and making recommendations on the coordination of library automation in Canada..."

The A.U.C.C. has set up a standing Committee on Library Automation in Canada. At its first meeting in Ottawa it was decided to send a questionnaire to every university librarian in order to make an inventory of the projects on library automation.

would you just answer the first question. If you do not have any project planned or in progress,

For any project planned, in progress or completed would you answer part II for each one of them.

promptly to this questionnaire which we would like to receive by June the 9th at the latest. We would appreciate your cooperation in answering

as it will be ready. We will send you copy of the compiled report as soon

Association of Universities and Colleges of Canada Committee on Library Automation

Minority Report

by Ritvars Bregzis

As I review the developments, trends and issues covered by the

argument and **a correspon**ding recommendation emerge. deliberations of the AUCC Committee on Library Automation the following

on Library Automation. However, I cannot agree with the Committee's Report on the things which need to be standardized, or on the way it These points are obvious and are agreed upon by the whole AUCC Committee The National Library clearly has a leading role to play in this effort. standards, which will be compatible nationally and internationally. community owes it to itself to participate in the work towards proper certain level of standardization and compatibility. The library automation, must certainly work together to establish and maintain a Canadian research libraries, in order to realize the benefits of

range of implications and longer term possibilities of bibliographic more important that it provide a systematic overview of the entire should cover present practices and immediate possibilities, but even It is important that the consideration of library automation
